

PRACTICAL NO : 05

AIM: Create a snow fall in unity

Steps:

1. **Create the Particle System**
 - Go to **GameObject** → **Effects** → **Particle System**
 - Rename it “**Snowfall**” (optional, keeps things tidy).
2. **Set the Shape**
 - In the **Inspector** → **Shape** → **Box**
 - Scale it: **X = 15, Y = 20, Z = 20**
 - This spreads snow across a large area instead of one point.
3. **Control Particle Movement**
 - **Start Speed = 0** → keeps snow from flying randomly.
 - **Velocity over Lifetime**
 - **X = 0, Y = -1, Z = -2** → (linear X) makes flakes fall downward, slightly drifting forward.
4. **Adjust Emission**
 - **Emission** → **Rate over Time = 100**
 - Makes snowfall dense and continuous.
5. **Randomize Flake Size**
 - **Start Size** → **Random Between 1 and 2**
 - Gives a natural look with flakes of slightly different sizes.
6. **Add Shrink as They Fall**
 - **Size over Lifetime** → **curve from 1 to 0**
 - Flakes shrink as they fall, making it look like they disappear on the ground.
7. **Add a Wind Effect**
 - **Noise** → **Strength = 0.2**
 - Snowflakes sway slightly, not just falling straight down.
8. **Change the Background Color**
 - Go to **Window** → **Rendering** → **Lighting** → **Environment** (or **Main Camera** → **Background**)
 - If you do it in the camera:
 - Select your **Main Camera** in the Hierarchy
 - In the **Inspector** → **Camera** → **Background**
 - Click the color box and choose a **White**
9. **Add a Ground**
 - **GameObject** → **3D Object** → **Plane**
 - Scale it so snow has somewhere to “land” (X = 50, Z = 50 works well)
 - Change the color of the plane:
 - Select the **Plane** → **Inspector** → **Mesh Renderer** → **Materials** → **Element 0**
 - **Click of project assets** → **Material** → name it as “**ground_mat**” → click on it and change its **Base Map** color into **White**.
